

## MPR-Support channels

hot-dip galvanised

**Application**

- Ideal for pipe installation as support structure for air ducts in interiors and exteriors
- Variety of mounting options e.g. for shelves in combination with extensive range of system components

**Your advantages**

- Fast and efficient attachment of piping and pipe routes
- High bending stiffness due to the cross-section design
- Scale marks sideways and on the side with the slot simplify the alignment of the attachment elements during installation and facilitate the measuring and cutting to length of the section on site
- For secure fixing that is adjustable laterally and vertically
- For setting up structures with correctly measured static loads by means of diverse connection components
- Meshing into the channel slot for positive-fit attachment of add-on parts
- Clean-cut appearance by the use of MPR-protection caps

\* Please note additional information on the catalog pages of threaded plates/hammer head fasteners.

The determined loads apply for static loads. Calculation based on Eurocode (EC3).

The safety coefficient  $\gamma = 1.54$  takes into account the partial and combination coefficients as well as the safety factor of the material.

For the given values, the permissible steel stress and the maximum permissible deflection  $L/200$  are not exceeded, taking the deadweight into consideration.

### MPR-Support channels

Technical data

Buckling loads as per DIN EN 1993-1-1 sections 6.2 and 6.3.

The values in the table apply for fully bearing cross-sections and central load transmission!

The potentially lower slenderness parameter for buckling and lateral torsional buckling must be examined separately!

Buckling about the z-axis and the y-axis was considered.

The least favourable buckling load is documented in the table.

The safety coefficient  $\gamma = 1.54$  takes into account the safety and combination coefficients as well as the safety factor of the material.

Determine the authoritative buckling length  $L_k$  depending on the storage conditions and the rod length  $l$ , as shown in the figure.

Read off the buckling load  $F$  as  $L_k$  from the table.
