

MPT-Support profile Q100 with 3 slots

hot-dip galvanised

Application

- For support structures used in heavy-duty building technology and on industrial and plant building sites
- Additional mounting slot increases connection possibilities, for example for 3D fixtures

Your advantages

- For construction of safe structures due to the high load-bearing capacity of the profile
- Saves time and costs due to functional accessories that are matched to the support profile
- High corrosion protection due to standardised hot-dip galvanising ensures flexible implementation outdoors and indoors
- Clean-cut appearance by the use of MPT-protection caps

-  The determined loads apply for static loads. Calculation based on Eurocode (EC3).
 The safety coefficient $\gamma = 1.48$ takes into account the partial and combination coefficients as well as the safety factor of the material.
 For the given values, the permissible steel stress and the maximum permissible deflection $L/200$ are not exceeded, taking the deadweight into consideration.

MPT-Support profiles

Buckling loads

Buckling loads as per DIN EN 1993-1-1 sections 6.2 and 6.3.

The values in the table apply for fully bearing cross-sections and central load transmission!

The potentially lower slenderness parameter for buckling and lateral torsional buckling must be examined separately!

Buckling about the z-axis and the y-axis was considered.

The least favourable buckling load is documented in the table.

The safety coefficient $\gamma = 1.54$ takes into account the safety and combination coefficients as well as the safety factor of the material.

Determine the authoritative buckling length L_k depending on the storage conditions and the rod length l , as shown in the figure.

Read off the buckling load F as L_k from the table.

$$L_k = 2,0 \times l$$

$$L_k = 1,0 \times l$$

$$L_k = 0,7 \times l$$

$$L_k = 0,5 \times l$$
