

### MPC-Support channels

H-Profiles, sendzimir galvanised

#### Application

- Ideal for space-saving support of multisection pipeways between ceiling beams
- Ideal for pipe installation as support structure as well as for air ducts in dry interiors
- Variety of mounting options for pre-wall installations and shelves in combination with extensive range of system components

#### Your advantages

- Fast and efficient attachment of piping and pipe routes
- Ideal combination of high bending stiffness and ease of installation
- Channel slots on both sides allow simple and quick alignment of all suspended and floor-mounted pipe supports
- Scale marks sideways and on the side with the slot simplify the alignment of the attachment elements during installation and facilitate the measuring and cutting to length of the section on site
- Suitable vibration control elements for all support channels available
- Clean-cut appearance by the use of MPC-protection caps

Profile 38/48

Profile 38/80

Profile 40/120

#### Features

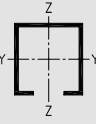

Profile	Length [mm]	Part no.	Sales unit	Pack unit
38/48/1.75 H	6,000	141179	1	Pieces
38/80/2.0 H	2,000	129870		
	4,000	129872		
	6,640	129874		
40/120/3.0 H		129875		

 For use in areas with requirements on the duration of fire resistance, the boundary conditions set out in the fire test report must be observed.

The determined loads apply for static loads. Calculation based on Eurocode (EC3).

The safety coefficient  $\gamma = 1.54$  takes into account the partial and combination coefficients as well as the safety factor of the material.

For the given values, the permissible steel stress and the maximum permissible deflection  $L/200$  are not exceeded, taking the deadweight into consideration.

## MPC-Support channels

Technical data

Buckling loads as per DIN EN 1993-1-1 sections 6.2 and 6.3.

The values in the table apply for fully bearing cross-sections and central load transmission!

The potentially lower slenderness parameter for buckling and lateral torsional buckling must be examined separately!

Buckling about the z-axis and the y-axis was considered.

The least favourable buckling load is documented in the table.

The safety coefficient  $\gamma = 1.54$  takes into account the safety and combination coefficients as well as the safety factor of the material.

Determine the authoritative buckling length  $L_k$  depending on the storage conditions and the rod length  $l$ , as shown in the figure.

Read off the buckling load  $F$  as  $L_k$  from the table.
